Analyzing data

I worked on charts that would answer the following questions:

1. What is the most famous dog breed?
2. What is the most famous dog name?
3. What is the average account performance?

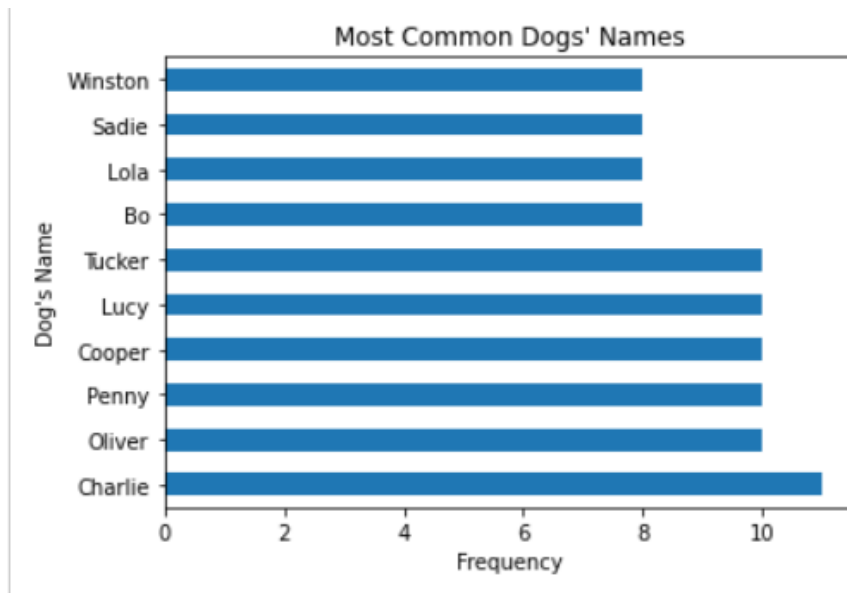

My aim is to know what is the criteria of a famous dog, and to make sure that the data I'm using is a big enough sample.

1. What is the most famous dog breed?

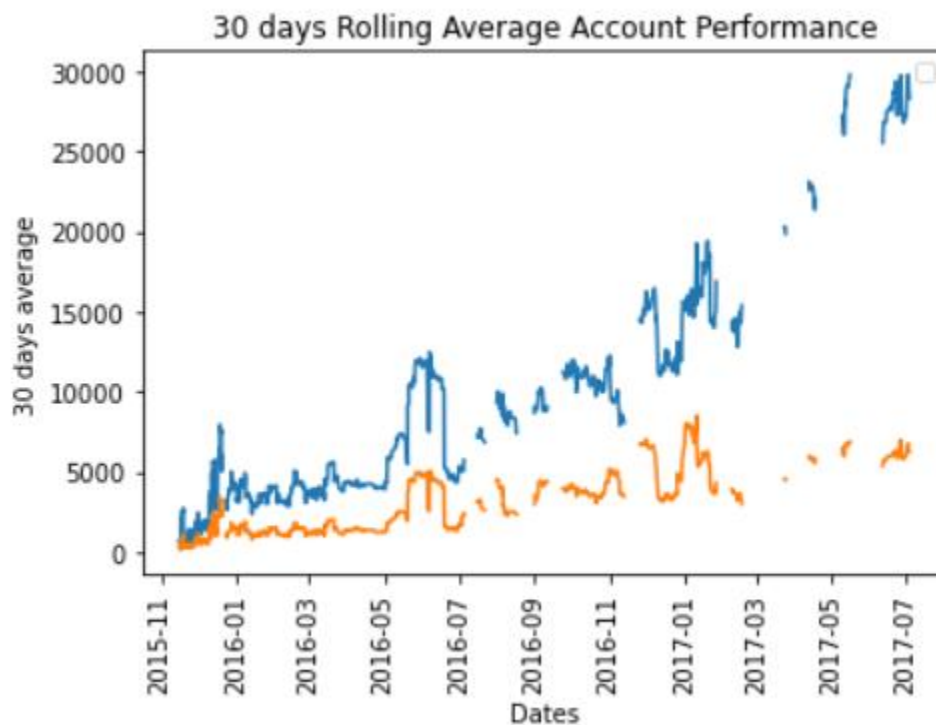

Golden Retriever is the most famous breed followed by Labrador and Pembroke

2. What is the most famous dog name?

Charlie is the most common dog name along with Oliver, Penny and Cooper

3. What is the average account performance?

The number of retweets and favorites grew exponentially over 2017

Validation

I went through the "twitter_archive_master" sheet and found that the most favorited dog and most retweeted is a Labrador! that validates my analyses. (tweet id:744234799360020481)

That doesn't prove the most famous dog name question because sadly there was no dog name mentioned in the tweet.
